

AI Agent Orchestration

Secure, identity-aware AI agent execution for the enterprise

Seed Fundraising

Confidential

Market Problem

AI agent demand is outpacing enterprise trust and control frameworks.

Enterprises are being mandated to automate operations — but autonomous execution lacks the controls security teams require.

Security teams block production deployment of AI agents due to weak identity, policy, and audit guarantees.

Policy-only governance fails under SOC 2, SOX, and FedRAMP scrutiny — logs, evidence, and isolation are non-negotiable.

No platform exists at the execution layer. Enterprises are forced to stitch together agents, IAM, and monitoring manually.

Why Now

Four forces are converging — this window won't stay open.

LLMs Hit Production Grade

GPT-4, Claude 3, Gemini Ultra crossed reliability thresholds in 2024. Enterprises aren't evaluating agents anymore — they're deploying them.

Regulatory Deadlines Are Here

EU AI Act enforcement begins 2025. SEC AI disclosure rules are active. CISO teams are blocked from shipping agents without audit evidence.

Enterprise AI Mandates Are Set

Fortune 500 boards have approved AI transformation roadmaps. Budget is allocated. The blocker is now trust infrastructure, not intent.

Tool Sprawl Is Tipping

The average enterprise runs 4–7 agent frameworks with no common execution layer. Complexity is forcing consolidation — now.

Early Demand Signal

We've started the conversations — here's what we're hearing.

2

Pilot scopes
drafted with security teams

CISO, F500 Financial Services

"We've had three AI agent incidents in six months. We can't give agents credentials without an audit trail."

VP Platform Engineering, FinTech

"Every team is building their own agent runner. I need one place to govern all of it before we get acquired."

Enterprise Architect, Healthcare

"Our compliance team killed our pilot. We need pre-execution policy gates, not post-hoc logging."

MVP: The Focused Wedge

We're not building everything — we're solving the hardest blocker first.

Building Now

Identity + scoped credentials per agent run

Pre-execution policy gate (allow/block/audit)

Structured task intake via Jira + web form

Tamper-evident execution log for audit export

Intentionally Later

Multi-cloud runtime support

Self-hosted deployment option

Agent marketplace / registry

Full no-code agent builder

Cross-tenant workload routing

Architecture & Trust Boundaries

Shared control plane with isolated tenant execution environments.

Identity & Access Model

Identity is enforced pre-execution, not retrofitted post-incident.

Scoped Identities

Least-privilege permissions per run — no standing over-provisioned access.

Short-Lived Credentials

Minimize standing access risk with time-bound credential issuance.

Policy Gates

Block unauthorized task actions before execution begins.

Full Traceability

Clear who/what/when attribution for every agent activity.

Security & Compliance Posture

Control stack designed for Fortune 500 operational requirements.

PII Isolation

Tenant-segmented data boundaries prevent cross-tenant exposure.

Network Controls

Private network controls and transport protections throughout.

Vulnerability Scanning

Continuous scanning across all agent runtime surfaces.

Patch Lifecycle

Integrated patch lifecycle for agent workloads on EKS.

Evidence-Ready Logging

Audit-ready logs for internal governance and external regulators.

Workflow & User Experience

Enterprise teams submit work through existing systems, not new behavior.

Who Buys First

One buyer, one pain, one clear path to value.

Primary Buyer

Title

CISO or VP Platform Engineering

Company

Fortune 500 in Financial Services, Healthcare, or Gov-adjacent Tech

Pain

Board-mandated AI rollout blocked by security team. Needs audit evidence, not just policy docs.

Trigger

Failed AI pilot, compliance audit finding, or competitor AI deployment

Entry Use Cases

Incident enrichment & triage

Patch verification workflow

Compliance evidence generation

Expansion Path

1 workflow → department standard → enterprise platform

Champion: DevOps / SRE lead who owns agent runtime today and wants a defensible audit story.

Why Won't AWS Just Build This?

They've had the pieces for years. The gap is intentional — and structural.

AWS Bedrock / Azure AI

Optimized for model serving, not agent execution governance. No identity-per-run, no pre-execution policy gate, no tenant isolation at account level. Filling this gap cannibalizes their IaaS lock-in strategy.

Hyperscalers Move Slowly at the App Layer

Cloud platforms don't compete in enterprise workflow tooling — that's how Datadog, Okta, and HashiCorp all won. Compliance controls at the execution layer are a product decision, not an infrastructure feature.

We Sit Above the Cloud — Multi-Cloud by Design

Enterprises don't want their agent governance locked to one cloud. Our control plane is cloud-agnostic; tenant isolation uses AWS today but the model extends to GCP and Azure. That's a non-starter for AWS to build.

Existing Agent Frameworks (LangChain, AutoGen, CrewAI)

These are developer tools, not enterprise platforms. They have no identity model, no policy enforcement, no audit log, no SLA. We orchestrate across them — we're the execution layer they're missing.

Team

We've built and shipped enterprise security infrastructure together before.

CEO & Co-Founder

Founder Name

Previously: [Company] — built identity and access platform serving 200+ enterprise customers. Led security product from 0 to \$40M ARR.

CTO & Co-Founder

Founder Name

Previously: [Company] — architected multi-tenant Kubernetes runtime at scale. 10+ years in cloud-native infrastructure and distributed systems.

Head of Security & Co-Founder

Founder Name

Previously: [Company] — led compliance engineering for SOC 2 / FedRAMP programs. Deep expertise in audit evidence and enterprise governance.

We have shipped together before — same team that built and scaled [prior product]. We know where enterprise security actually breaks.

On-Demand Scheduling Product

One platform for routine automation and burst operational demand.

Scheduled Jobs

Recurring high-volume workflows with predictable cadence and SLA guarantees.

Event-Triggered Workloads

Urgent incidents and operational spikes handled with instant burst capacity.

Resource Orchestration

Policy, priority, and SLA-driven assignment of execution resources.

Usage Metering

Cost transparency and chargeback models for internal accountability.

Business Model

Predictable platform revenue with execution-driven expansion.

Annual Subscription

Control plane + baseline enterprise controls. Target: \$150–250K ACV at launch.

Usage-Based Billing

Execution volume tiers for on-demand and burst workloads. Expands naturally with adoption.

Enterprise Modules

Advanced governance, private networking, and SIEM integration add-ons.

Expansion Dynamics

Land in one team → standardize across org. ACV grows 3–5x from initial to full deployment.

Competitive Positioning

We compete on operational trust, not only agent capability.

Account-Level Tenant Isolation

AWS micro-account architecture provides structural separation competitors can't replicate with config alone.

Pre-Execution Identity Validation

Policy gates and scoped credentials enforced before any agent action begins.

Integrated Security Scan/Patch

Runtime vulnerability scanning and patch lifecycle built into the execution plane.

Structural Moat: Trust architecture + Orchestration intelligence + Workflow embedding

Go-To-Market Strategy

Compliance-led land-and-expand with integration-first adoption.

01

Land

Convert 2-3 design partners from existing pipeline into paid pilots (Q1-Q2).

02

Prove

Deliver measurable outcomes in 60-90 days: audit pass rate, incident MTTR, blocked unauthorized agent actions.

03

Expand

One workflow → department standard → enterprise platform. ACV grows 3-5x per account.

04

Leverage

Cloud and security partner channel (AWS ISV, Palo Alto MSSP) for inbound pipeline at scale.

Roadmap & Milestones

Concrete outcomes, not just activities.

0-6 Months

2 paid pilots live. Control plane in production. First audit evidence package delivered to a customer.

6-12 Months

3+ enterprise contracts signed. \$500K+ ARR. 2 integration partners (Jira, SIEM). First annual renewal.

12-18 Months

\$2M+ ARR. 10+ enterprise accounts. Avg ACV expansion 2x from land. Series A raise ready.

Key Metrics: # paid pilots · ARR at 12 months · ACV expansion rate · Time-to-audit-evidence < 30 days

Fundraise & Use of Funds

Seed capital to establish category leadership in secure agent execution.

What This Round Achieves

- Convert 2-3 design partners to paid pilots
- Deliver first production-grade audit evidence package
- Reach \$500K ARR by month 12
- Investor outcome: category-defining position in enterprise AI infrastructure
