

SaaS Platform Conceptual Design

Master Overview and Cross Segment Reference

Goji Labs

This is the parent document. It carries only the platform overview and the concerns that span more than one segment. Anything specific to a single segment lives in that segment's own design doc, linked from the index below.

1. Document Control

Field	Value
Document owner	[Stephen Banner]
Status	[Draft / In review / Approved]
Version	[0.1]
Last updated	[date]
Reviewers	[names]

Revision History

Version	Date	Author	Summary of change
[0.1]	[date]	[author]	[initial skeleton]
[]	[]	[]	[]

2. Purpose and Scope

State in two or three sentences what the platform is and what this document is for. Define what is in scope here versus what is deferred to segment docs.

Purpose:

[What problem the platform solves and for whom.]

In scope for this document:

- Platform level overview and how the segments connect
- Concerns shared across two or more segments

Out of scope (covered in segment docs):

- Detailed design internal to any single segment

3. Platform Overview

One narrative and one architecture diagram. Describe the major moving parts and the flow of a request through the system at a high level.

Narrative:

[How the platform works end to end, in plain language.]

Architecture diagram:

[Insert the system context or container level diagram here. Keep it to a single page.]

4. Segment Index

Each segment keeps its own design doc. This table is the map. Update the link and owner as docs are created.

Segment	What it covers	Owner	Link
Agent Orchestration	[planner, worker, reviewer coordination]	[]	[link]
[Intake and Planning]	[]	[]	[link]
[RAG and Data]	[]	[]	[link]
[DevOps Agents]	[]	[]	[link]
[]	[]	[]	[link]

5. Cross Cutting Concerns

This is the heart of the parent document. Anything that touches more than one segment is described here once, so each segment doc can reference it instead of repeating it.

5.1 Shared Data Model

[The entities and contracts that more than one segment depends on. Keep field level detail in segment docs.]

5.2 Identity, Authentication, and Authorization

[How identity is established and how access is scoped across the platform. Note the shared mechanisms, for example Cognito, LDAP group mapping, and least privilege agent identities.]

5.3 Inter Segment Interfaces and Contracts

[The boundaries between segments: queues, message formats, APIs, and the guarantees each side relies on. Changes here ripple, so they belong in the parent.]

5.4 Governance, Safety, and Audit

[The controls that span the whole platform: guardrails on messages between agents, human in the loop approval gates, break glass escalation under dual control, risk tiering, and the audit trail. This is where the governance story reads as one coherent picture.]

5.5 Observability and Operations

[Logging, telemetry, and monitoring shared across segments, for example CloudWatch and Datadog. Runbooks and alerting that apply platform wide.]

5.6 Nonfunctional Requirements

Dimension	Target
-----------	--------

Security	[]
Availability	[]
Performance	[]
Scalability	[]
Compliance	[]

6. Architectural Principles and Decisions

State the guiding principles, then log the significant decisions so the reasoning is not lost. One row per decision.

Principles:

- [for example, build controls into the system rather than bolt them on]

Decision log:

ID	Decision	Rationale	Status
[D1]	[]	[]	[]
[D2]	[]	[]	[]

7. Open Questions and Pending Decisions

Park unresolved items here so they do not get buried inside segment docs.

ID	Question	Owner / next step
[Q1]	[]	[]
[Q2]	[]	[]

8. Glossary

Define platform terms once so segment docs can stay lean.

Term	Definition
[term]	[]
[term]	[]
